## ACKNOWLEDGEMENT

It is our pleasure to acknowledge you that we have received a project on Smart Voting System from our teacher. It is a great opportunity of highlighting a fraction of knowledge, we acquired by during my technical education through this project.

This wouldn't have been possible without the guidance's and help of Such people. This is the only a page where we have the opportunity of expressing our emotions and gratitude from the bottom of our heart to them.

Our first sincere appreciation and gratitude goes to **Prof. Chandan Gadge** Sir for his guidance, constructive comments, valuable suggestions and inspirations. During making of this Project, he helped us a lot. Being one of the same lines as well express our deep sense of gratitude to our head of the department **Prof. R. A. Tiwari** for this most valuable guidance provided by him.

We would like to thank Prof. **R. M. Deshmukh** principle of our institute for proving necessary facility during the period of working on the project. Last but not the least, we would like to express our thankfulness to teaching and non-teaching staff, my friends and all for this great support & wishes

# **Smart Voting System**

## **Abstract**

The Smart Voting System is an android application that provides a new technique of casting votes using mobile phones. This application is especially developed for organizations, corporations, Collages/educational institutes and commercial businesses to get people's opinions whenever there is any new policy implemented or any issue being investigated or during controversies.

The project provides an effective solution in resolving all the arguments that occurs in organizations by considering all people's opinions.

# Chapter 1.

# Introduction

## Introduction

The voting process by registered voters is very unmanageable. So many cases of missing data in the voter registration files have been reported. There are also scenarios where unregistered voters flock in as "Dead Voters" to participate in the voting process. Even after voting, malicious clerks and officers-in-charge. This results in the release of wrong results leading to cases of post-election violence

For solving this issue, the system has an admin login that has overall control over it. Admin feed the issues or arguments in the system along with desired options. These questions can then be visible to all the registered users through android devices. Employees have to first create an account into the system for casting their votes. At the end of the voting process the system counts all the votes casted and generates a brief report of the total votes accounted for yes, no and neutral. Eventually, the report is made available to admin and he may view the maximum votes casted for. Hence the system helps admin to receive appropriate response from employees for the matters in question.

The requirement for a reliable and unique identification of a person in the development of digital world has been a great motivation for the research in biometrics, National ID, electronic commerce are some scenarios where declarations of a person's identity is very crucial. Voting too falls in such scenario where an individual's data serves such an important role in the process. The most severe and frequently happening situations while voting is rigging (One person give multiple votes). Right now, we are using an electronic voting machine and to identify whether someone has voted, an ink mark is done on the finger.

But today because of rapid development in technology, that can be erased and there are chances of rigging. Through this project, we are going to create a unique Fingerprint based Voting system in order to avoid the problem of multiple votes, faking identity and also completely eliminate the concept of applying ink thus leading to a fair election. Therefore, it ensures reliability, accuracy. Confidentiality which are considered to be the heart traits of the fingerprint voting system. Fingerprint voting system:

Biometric Finger print devices are used in the electronic Voting machine for voter verification. We will discuss a finger print based voting system.

The system aims at developing a fingerprint based advanced Electronic Voting Machine (EVM) which helps in free and fair way of conducting elections which are basis for democratic country like India. This project consists of following units a Voting system, fingerprint module and ARM controller Unit. The voter first puts his finger on the fingerprint module which checks for the authentication of the user. If the voter is the authenticated one, he will now poll his vote in the voting system by simply pressing button against his favorite leaden through a button.

In a democratic system of governance, election is very crucial and the integrity of the electoral process is sacrosanct. Election is a repetitive operation that occurs every specified period of time. Adding to that is the fact that there are different types of elections and/or different scopes of elections and the need to support multiple elections.

Democracy this encourages individual freedom according to the rule of law, so that people may behave and express themselves as they choose. This not only gives people a chance to choose their leaders, but also to freely express their views on issues

### **This Project is divided into**

- 1.Login Module
- 2.Login Through Fingerprint Module
- 3.Registration Module
- 4.Home screen Module
- 5.Splashscreen Module
- 6.Result Module

# Chapter 2.

## Literature Survey

## **Existing System**

**Election (Definition, Types and History)** An election is a formal decision-making process by which a population of society chooses an individual to hold a political office. Elections have been the usual mechanism by which modern representative democracy operates that predates to as early as the 17th Century. Elections are conducted both by public entities such as the government as well as private and business organizations, for example, choosing representatives for the Board of Directors of a company, professional club leadership and even used in voluntary associations. **Types** In most democratic political systems, there are several types or categories of elections that are held which corresponds to the different layers of public governance or geographical Jurisdiction. Common types of election categories thus include Presidential Elections, Parliamentary Elections, Convenorship Elections, Local Government Elections. Considering our given domain, that is, within the university political sphere, there are also various types of elections that are conducted based on several criteria that help in delineating the staff of the university into categories such as Academic or Non-Academic, Senior Staff, Cooperative Union, to mention a little.

**Voting System** There are two categories under which voting systems can be classified, namely

- Traditional or Paper-Ballot Voting Systems
- Electronic Voting Systems

### **Traditional Paper-Ballot Voting Systems**

The paper-based voting system can be described as the traditional means of voting that has been in use over the ages. It is also the default method of conducting elections in India as well as other countries around the world. It operates by issuing paper ballots to eligible voters who present themselves at the polling unit on the day of the election. The voter is authenticated by searching for and ticking his or her name on the voters register for that particular polling unit. Indelible ink is used to mark an authenticated voter by dropping the ink on the voter's left thumb fingernail. The voter is then expected to proceed to a secret booth to vote a candidate by pressing his right thumb into an ink stamp and placing the inked fingerprint in front of the chosen candidate on the ballot paper given and subsequently required to drop the ballot paper into a ballot box placed in an open place within the polling unit.

## **Electronic Voting Systems**

The Council of Europe recommendations defined electronic voting (e-Voting) as "the use of Electronic means in at least the casting of the vote" (Krimmer, et al., 2007). Electronic voting is a term encompassing several different types of voting, embracing both electronic means of casting a vote and electronic means of counting votes. Electronic voting systems are complex distributed systems, whose components range from general-purpose PCs to optical scanners and touch-screen devices, each running some combination of commercial off-the-shelf components, proprietary firmware, or full-fledged operating systems. It is a fundamental demand of countries to enhance their election system. Now due to rapid emergence of technologies in computer and telecommunication world e-Voting based systems are to be introduced that lessens all the traditional manual election systems' problems. With the introduction of e-Voting systems our elections processes and social lives are going to be easy, efficient and low-cost. Now in this system voters can cast their votes from anywhere in world.

E-voting system must meet security requirements such as confidentiality, integrity, fairness, forgery attack, verifiability and so on. This is because E-voting system is more vulnerable than traditional voting due to the nature of digital processing of election data which can be easily manipulated, hence may result in widespread fraud and corruption. Voting is getting to be seen a next generation approach of election in almost all countries. The ultimate aim of e-Voting is to provide voters a good environment so that voters can cast their votes with minimum cost and efforts on the internet. Up to now there are so many properties have been proposed to make the e-Voting secure process, among them some are the below given must be satisfied.

- 1- In existing system, if you wish to vote for someone, then you have to go to the destination where the voting procedure is going on and then only you can vote for him or her.
- 2- Existing system does not provide people the way in which they can get the details about the nominees as well. They can't get to know the history of the people for whom they are standing in queue for giving their votes.

3- The problems of the existing manual system of voting include among others the following:

- Expensive and Time Consuming
- Too Much Paper Work
- Errors during data Entry
- Loss of registration forms

# Chapter 3.

## Project Scope

## Objectives

- Proposed system is highly automated and greatly technical in this system, not even you can vote via sitting at your own place but also you can learn about rules and regulations related to voting.
- Also, not only this but you can access the profile of the nominees through which you can learn about their history, their education, and their personal details and so on.
- Using this online voting android-based project, end users do not face any difficulties as because they don't have to make registration before submitting their feedbacks.
- Provision of improved voting services to the voters through fast, timely and convenient voting.
- Reduction of the costs incurred by the Electoral Commission during voting time in paying to many clerks employed for the sake of the success of the manual system.
- Check to ensure that the members who are registered are the only ones to vote. Cases of "Dead People" voting are also minimized.
- Less capital, less effort, and less labor intensive, as the primary cost and effort will focus primarily on creating, managing, and running a secure online portal.
- So, there are less chances of multiple voting by single voter and hence less chances of manipulation in this system of voting.
- The Smart Voting System is an android application on phones.
- This application is especially developed for organizations, corporations, educational institutes and commercial businesses to get employees opinions whenever there is any new policy implemented or any issue being investigated or during controversies.
- The project provides an effective solution in resolving all the arguments that occurs in organizations by considering all employees opinions
- Overview of the System
- The Smart Voting System is an application which is a new process of casting votes from any place and at any time.
- The proposed system is a flexible means of casting the votes irrespective of the place and time of the day.

### **Merits of this application:**

- The system can be used anytime and from anywhere by the employees.
- It excludes the use of manual voting process.
- Employees can keep themselves updated with all things going on in the organization.
- No one can cast votes on behalf of others and multiple times.
- Saves time and reduces human intervention.
- It makes employees happy as their opinions are considered for the matters in organization.
- Admin can get instant result.
- The system is flexible and secured to be used.

### **Demerits of this application:**

- Every Voter must have an android device for casting the vote.
- It requires a reasonable degree of literacy and numeracy to be used effectively
- Vulnerability to hacking
- Voter verified All fully-electronic (touch screen, internet) voting systems are subject to the limitations and risks of computer technology.
- This includes the inability to detect the presence of hardware and/or software that could be used, deliberately or inadvertently, to alter voting outcomes.

## **Modules of the System**

- **Voter Module:**

In this module, all the process related to voting and votes are given into this module. Voters can access to this module via their personal account only.

In this module, user who is going to give his or her vote have to make his or her account in order to get access to the voting system and into the modules which contains details about the Vote.

- **Admin Module:**

Admin checks the data and the valid voter. Admin also gives the result once the Voting is conducted.

Only Admin is authorized to check the Result

# **System Requirement Analysis**

## **Functional Requirements**

- The system will be able to allow the Voters to create an account.
- Allow registered users to login to the system.
- The system should authenticate users during login.  
i.e., the user should be what he/she claims to be.
- The system should allow an authenticated user to cast a vote.
- The system should send voting results to Voters.
- The system should allow the administrator (voting officer) to Manage Voters.

## **Non-Functional Requirements**

- System will support response time for addressing severe issues in less time.
- System will provide documentation to inform users of system functionality and any change to the system.
- System will provide friendly graphical Interface to ensure ease of use when end users utilize system functionality. (Usability)
- The system will be able to be integrated in future if need be.
- The application will be available all the time for Voters on Google play to download.

## System Architectural Design

The Online Voting System's architectural design is a diagram that defines the relationship between major structural elements of the software, the design patterns that can be used to achieve the requirements defined for the system and the constraints that affect the way in which architectural design patterns can be applied

Architectural Diagram of smart voting system

## Flowcharts

# Chapter 4.

# Database Diagram

# Database Design

- 1- The Database Designer is a visual tool that allows you to design and visualize a database to which you are connected.
- 2- When designing a database, you can use Database Designer to create, edit, or delete tables, columns, keys, indexes, relationships, and constraints.
- 3- To visualize a database, you can create one or more diagrams illustrating some or all of the tables, columns, keys, and relationships in it.

# Chapter 6.

## Conclusion & Futures

### Scope

## Conclusions

This project was designed to implement a system that will be used for election process using the as case study. The integration of biometric authentication within the system will provide an efficient way to cast votes, free of fraud, and make the system more trustable, economic and fast as well as enabling the voters to cast their votes from any location as a result of the online voting module which can be accessed from any device with internet connectivity. The use of fingerprint recognition deepens the process of ensuring that the voting **Slogan-one man, one vote** is fully enforced.

The project is of immense benefits to the University as it protects and secures the integrity of the university's staff elections, reduces administrative work and improves the staff election's creditability rating which subsequently strengthens internal democracy and trust among the staff

This online Voting system will manage the Voter's information by which voter can login and use his voting rights. The system will incorporate all features of voting system. It provides the tools for maintaining voter's vote to every party and it count total no. of every party. There is a database which is maintained by the admin in which all the names of voter with complete information are stored.

This is a simple visualization of the site's screens in the design, analysis and initial thinking of the Application. Changes may be made to this design during the final implementation phase of the site. I hope that my project will be on your satisfaction and God is the conciliator

## **Future scope**

- As this application provides better way of election between Voter and Candidates hence, we suppose that this project as a greater scope and is important requirement is to provide a compact stable system of voting with a facility through online/Mobility.
- Data can be managed on cloud so that it will be secured and managed efficiently.
- We can add more security by adding face recognition.
- This will have huge potential growth in online voting system.
